Universal hi-fi audio processor for TV

TDA9859

FEATURES

- Multi-source selector switches six AF inputs (three stereo sources or six mono sources)
- Each of the input signals can be switched to each of the outputs (crossbar switch)
- Outputs for loudspeaker channel and peri-TV connector (SCART)
- Switchable spatial stereo and pseudo stereo effects
- Audio surround decoder can be added externally
- Two general purpose logic output ports
- I²C-bus control of all functions.

GENERAL DESCRIPTION

The TDA9859 provides control facilities for the main and the SCART channel of a TV set. Due to extended switching possibilities, signals from three stereo sources can be handled.

TDA9859

FUNCTIONAL DESCRIPTION

The TDA9859 consists of the following functions:

- Source select switching block
- Loudspeaker channel with effect controls
- Two port outputs for general purpose
- I²C-bus control.

Source select switching block

The TDA9859 selects and switches the input signals from three stereo or six mono sources MAIN, AUX and SCART (see Fig.1) to the outputs SCART and loudspeaker (crossbar-switching; Table 4). The main channel (LINE outputs) is looped outside the circuit (from pins 9 and 24 to pins 10 and 23), so signals can be used as LINE output or a surround sound decoder can be inserted.

Loudspeaker channel

Volume control is divided into volume control common and volume control left/right. The common part (–40 to +15 dB) controls the left and right channels

simultaneously; the left/right part (–23 to 0 dB) controls the volume of left and right channels independently. Treble control provides a control range from –12 to +12 dB and bass control from –12 to +15 dB. Extended bass control can be provided by an external T-network (see Fig.1) from –15 to +19 dB (2 dB steps).

Effect controls

'Linear stereo', 'stereo with spatial effect (30% or 52% anti-phase crosstalk)' and 'forced mono with or without pseudo-stereo effect' are controlled by three bits. A muting of 85 dB is provided.

I²C-bus control

All settings of control are stored in subaddress registers. Data transmission is simplified by auto-incrementing the subaddresses. The on-chip Power-on reset sets the mute bit to active, so both the SCART and the loudspeaker outputs are muted.

The muting can be switched off by writing a '0' (non-muted) into the mute control bits.

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact

with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
